

Water tube

or fire tube?

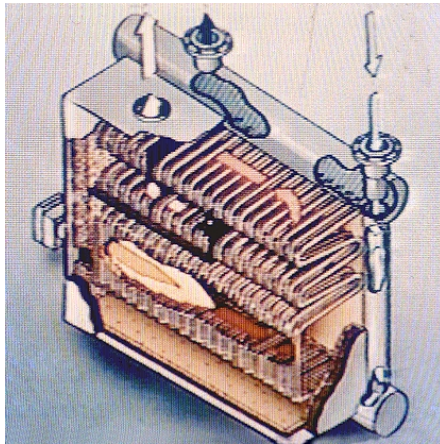

Bryan flexible water tube boilers last longer, take less space,

...otherwise the advantages are similar.

It's true. According to a major industry report Bryan flexible water tube boilers have an estimated service life of 35 to 40 years while fire tube boilers last only about 25 years.

And, the Bryan boilers require only about 24 to 32 inches along one side to remove and replace a water tube should it need service. A fire tube boiler needs a space the full size of the boiler footprint because the full length tubes have to be replaced from the end. That saves you from 30% to more than 50% total space required for your boiler installation depending on boiler configurations and capacity. That can reduce your construction costs.

Then, because Bryan flexible tube boilers have a full five square feet of heating surface per boiler horsepower, our boilers make better use of the heat, operat-

***operate at 85% efficiency,
are easier to maintain...***

ing at 85% efficiency.

Also, because it's easy to get to the tubes and cleaning is so much easier, you reduce the inconvenience of downtime with Bryan flexible water tube boilers.

Did we mention that because of the powerful natural circulation of heated water through the Bryan system that there is reduced thermal stress? In fact, Bryan water boilers have a full 20 year, non-prorated warranty against thermal shock damage.

With Bryan AB, RV and RW Series hot water or steam boiler sizes ranging from 21 to 500 BHP, you can match capacity to demand requirement almost

exactly, avoiding wasteful investment in excess capacity. Beyond these benefits, and the substantial dollar savings they can mean to you, you'll find not much difference. Contact us for more information.
