

electric immersion heaters

electric heating and controls

Introduction

INDEECO designs and manufactures commercial and industrial electric heating and control systems that set the industry standard for excellence. The company's heating solutions reflect more than 70 years of innovation, product quality and efficient service.

Our product offering ranges from the immersion heating products described in this catalog to the most sophisticated, custom designed system. INDEECO's attention to detail and rigorous testing give worldwide customers premium products that they receive quickly and at a fair market price.

Limited Warranty	48

Selection Guide

Selection Guide

Heater construction is selected on the basis of the following criteria:

- **Space Available** for both elements and headers. If a great deal of heat must be concentrated in a small volume, one heater with multiple elements should be used. If it is desirable to distribute the heat over a large volume, multiple heaters should be installed at intervals along the vessel.
- **Watt Density**, or watts per square inch of element surface area, compatible with the fluid heated and the maximum fluid temperature. See Table I for recommendations. The lower the watt density required, the larger the physical size of the heater.
- **Structural Strength** of the vessel, both for supporting the heater(s) and to maintain system pressure.
- **Controllability**, to determine how closely the temperature will be maintained. In addition to the selection of a control system it is often necessary to stage the heater to achieve good control. Distribution of heat also affects controllability.

Application Factors

Carry-over - Avoid contaminating the process with chemicals carried over from other processes. This can be particularly critical in plating and cleaning lines where parts may be dipped successively in different solutions.

Sludge - Be sure that heaters are located above the point of maximum sludge buildup since sludge will insulate the heater from the solution and cause premature failure.

Temperature - Control the process temperature as closely as possible. Excess temperature reduces heater life.

Heater Cycling - Match the heater wattage as closely as possible to the actual load requirements to limit on-off cycling.

Galvanic Action - Between the heater and adjacent metallic surfaces will cause premature heater failure and may similarly corrode the tank.

Maintenance - Routine heater maintenance will help prevent small problems from becoming serious. Heaters should be examined at regular intervals for corrosion and scale buildup.

Iron Content - In critical processes where no trace of iron can be tolerated, stainless steel heaters can be passivated with nitric acid before installation.

Headers - In some applications, the header material can be as critical as the sheath material. In those cases, specify the header to match the sheath and specify "welded joints" if the solution will attack silver solder.

Calculating KW Capacity

In general, KW capacity will be determined by one of two factors: the heat required to bring the process up to temperature, and the heat required to maintain the process at operating temperature. Both requirements must be calculated; heaters are selected on the basis of the method that results in the higher KW rating.

For assistance in calculating the KW capacity for your job, consult your local INDEECO representative.

Watt Density And Sheath Selection

Watt density and sheath material are the two most critical factors affecting immersion heater life. Watt density (watts per square inch of heater surface area) determines heater operating temperature for a given set of fluid conditions. Sheath material similarly determines the rate of corrosion. Both vary with fluid temperature.

Table I has sheath materials recommended for each fluid and temperature. Those with an "A" rating have the best corrosion resistance, a "B" rating indicates fair resistance. Where a range of watt densities are shown, the lower end of the range represents a more conservative design.

The maximum watt density shown is 75 watts per square inch. In some applications, even higher watt densities may be suitable depending upon the details of the application (fluid velocity, contaminants in the fluid, space between elements, etc.). Consult your local INDEECO representative if a higher watt density is desired.

Since we specialize in custom-built industrial heating equipment, INDEECO can review your applications that are out of the ordinary, including heaters for immersion in fluids not shown in the table.

While Table I represents our most current knowledge, many application factors are beyond our control. Thus, this table should be used only as a guide. INDEECO cannot be responsible for heater failures due to corrosion.

Recommended Sheath Material

¹Lead sheath can be used satisfactorily with this solution up to a temperature of 250° F.

²Inconel sheath can be used satisfactorily with this solution.

³Copper sheath can be used satisfactorily with this solution.

⁴Higher watt densities could be applied depending upon specific application.

⁵Boiling point of ammonia at 14.7 PSI is 28° F and at 292.5 PSI.

^cIncoloy can always replace steel or stainless steel.

Selection Guide

¹Lead sheath can be used satisfactorily with this solution up to a temperature of 250° F.

²Inconel sheath can be used satisfactorily with this solution.

³Copper sheath can be used satisfactorily with this solution.

⁴Higher watt densities could be applied depending upon specific application.

⁵Boiling point of ammonia at 14.7 PSI is 28° F and at 292.5 PSI.

⁶Incoloy can always replace steel or stainless steel.

Pipe Thread Heaters

Construction Features

1/2" and 3/4" Pipe Thread Heaters

Heating Elements - Cartridge-type construction consists of an 80/20 nickel-chromium resistance coil strung through a cylindrical ceramic core. This assembly is slipped into the metal sheath, which in turn is attached to a hex head pipe thread fitting. All voids are filled with magnesium oxide and the ends are capped.

Double Threaded Brass Pipe Thread Fittings - Silver soldered to the sheath, these are furnished as standard for both brass and steel sheathed heaters. The outlet box is held to the fitting with a locknut and can be easily removed or rotated to any convenient position after the heater is installed. Field connections are made to 6" stripped leads located in the outlet box.

Watt Density - Heaters are conservatively rated at 30 watts per square inch (brass sheath) and 20 watts per square inch (steel sheath).

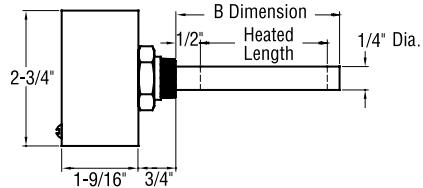

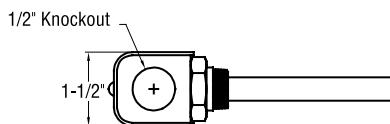

Galvanized Outlet Box - 1/2" and 3/4" pipe thread heaters are furnished with galvanized steel NEMA 1 outlet boxes as standard.

Special Sheath Materials - Type 304 stainless steel available to replace brass sheathed heater.

Special Header Materials - Steel and Type 304 stainless steel available for solutions that may corrode standard brass headers. For example, steel sheath and header must be used in ammonia solutions. Steel or Type 304 stainless steel headers will be welded to matching sheath materials.

Special Ratings - Custom wattages, voltages and immersion lengths are available in both pipe thread sizes.

Special Immersion Lengths - Intermediate lengths and elements up to 20 feet long are available.

Pipe Thread Heaters

Construction Features

1" — 2-1/2" Pipe Thread Heaters

- Element bends repressed uniformly to insure insulation integrity.
- One piece forging of hex, thread and riser assures reliability of brass pipe thread fittings (1-1/4" through 2-1/2").
- Element spacers prevent hot spots.
- Permanent bus bars prevent loose connections.
- Risers on brass pipe threads allow easy access with pipe wrench.
- UL label furnished on all standard copper, stainless steel and Incoloy sheathed heaters.
- CSA approval also available.

Tubular Elements are welded or silver soldered into a hex head pipe thread fitting. Elements have 80/20 nickel-chromium resistance coils centered in a heavy gauge metal tube surrounded by magnesium oxide insulation. Through rolling, the magnesium oxide is packed to a rock-like density for rapid heat transfer from the coil to the sheath. Elements are annealed, bent and then repressed to insure magnesium oxide integrity in the bent area.

1" and 1-1/4" pipe thread heaters have .312" diameter elements for operation up to 277 volts. 2" and 2-1/2" pipe thread heaters have .475" diameter elements suitable for operation up to 600 volts.

Pipe Thread Fittings of forged brass, silver soldered to the sheath, are furnished as standard with copper sheathed heaters. Steel and stainless steel sheathed elements are welded into fittings of like material.

Outlet Boxes are furnished on heaters without a built-in thermostat. A 4" NEMA 1 octagon outlet box having 3/4" knockouts is standard.

2" NPT stock heaters (without thermostats) are furnished with cast liquidproof outlet boxes.

Heaters with a built-in thermostat are normally furnished with a NEMA 1 rectangular sheet metal enclosure having combination 1/2"-3/4" knockouts. However, those heaters drawing more than 40 amps are furnished with welded steel outlet boxes having 1" or 1-1/4" hubs for electrical connections.

Built-In Thermostats provide automatic temperature control without the necessity of installing a separate well for the thermostat bulb in the field and making electrical connections between the heater and control. The thermostat is fully adjustable throughout its 60°-250° F range.

A Type DA Thermostat is provided on 1-1/4", 2" and 2-1/2" pipe thread heaters. It comes complete with integral ON/OFF switch, pilot light and external adjusting knob. It must be mounted in a vertical plane, never "on its back."

This thermostat comes in both two and three-pole models, which have the following load-carrying capacities:

Voltage	Capacity in KW	
	Single Phase	Three Phase
120	3.6	—
208	6.2	10.8
240	7.2	12.4
277	8.3	—
480	9.6	—

Heaters rated above these capacities require a magnetic contactor, with the thermostat controlling the contactor holding coil.

The thermostat's pilot duty rating is 250 VA at 277 volts maximum.

A Single-Pole, Single-Throw Thermostat is provided on 1" pipe thread heaters. It has a load-carrying capacity of 25 amps (up to 240 volts), 22 amps (up to 277 volts), and a pilot duty rating of 125 VA (up to 277 volts). It is housed in a zinc-plated handy box that can be mounted in either a horizontal or vertical position.

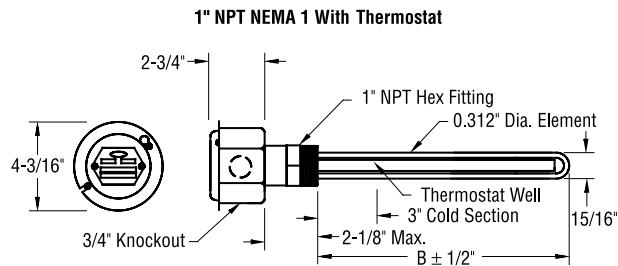

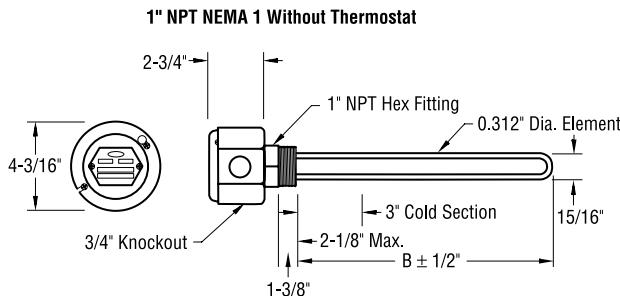

Element Spacers made from Type 304 stainless steel maintain a uniform distance between elements, thus preventing hot spots.

Epoxy Seals for a moderate resistant seal where fluid temperatures do not exceed 250° F.

UL and CSA Listings are available. All standard copper, Type 304 and 316 stainless steel and Incoloy sheathed heaters are listed by the Underwriters Laboratories under Reference E23541. These heaters, as well as steel sheathed heaters, are also available with the CSA (Canadian Standards Association) label under File No. LR11895. Some non-standard constructions can be UL and CSA labeled. Consult factory for availability.

Pipe Thread Heaters

Heater Options

Liquidproof NEMA 4 Outlet Box (Without Built-In Thermostat) - Cast box with threaded, gasketed cover and 3/4" NPT female threaded hubs for electrical connections. For applications where there is danger of moisture entering the outlet box.

Liquidproof NEMA 4 Outlet Box (With Built-In Thermostat) - Welded steel outlet box with enamel finish and gasketed cover. Pilot light is visible through lens cover. Two 3/4" NPT hubs provided for electrical connections. Stainless steel outlet box is available as an option, with two 1-1/4" NPT hubs.

Single-Pole, Single-Throw Thermostat on 1-1/2", 2" and 2-1/2" Pipe Thread Heaters - Where single-pole control for pilot duty is adequate, and neither pilot light nor an ON/OFF switch is required. 0°–100° F and 60°–250° F temperature ranges are available.

Alternate Thermostat Ranges, Type DA

Range °F	Pipe Thread Sizes (Inches)
0-100	All
150-550	1
200-550	1-1/4, 2, 2-1/2
300-700	1-1/4, 2, 2-1/2

Omit Outlet Box - For applications where heater terminals will be protected by field-furnished enclosures.

Special Sheath Materials - Incoloy 800, Inconel 600, Type 316 stainless steel and Monel 400 available.

Special Header Materials - Incoloy 800, Inconel 600 and Type 316 stainless steel headers available.

Passivated Sheath - Stainless steel sheath may be passivated with nitric acid to remove trace particles of steel that may be embedded during manufacture.

Vertical Mounting for 1-1/4", 2", and 2-1/2" Pipe Thread Heaters with Thermostat - Thermostat must be mounted vertically. Heaters with single-pole, single-throw thermostats can be mounted in any position without relocating the box.

Other Special Ratings - 2" and 2-1/2" pipe thread heaters available in 200, 277, 380, 400 and 600 volts. All sizes available with lower watt densities for special applications.

Longer Elements - Consult factory for length and wattage limits per element.

CSA Approval - Available on all standard heaters listed and on 2" and 2-1/2" pipe thread heaters rated at 600 volts.

A Single-Pole, Single-Throw Thermostat - In a 4" NEMA 1 octagon box with internal thermostat knob.

Type HA Thermostat - The DA box, with external manual reset button, has three contacts. Two cycle automatically and the third, auxiliary contact, opens on overtemperature. Temperature ranges of 60°–250° F or 200°–550° F are available with the following ratings:

Voltage-Single Phase	Capacity in KW
120	3.6
208	6.2
240	7.2
277	8.3

Longer Element Cold Ends - Cold ends are 3" for copper, stainless and steel, 6" for Incoloy. In vertically mounted heaters and other applications where the liquid will not completely cover the elements, immersion length should be increased by the length of additional cold end.

Construction Features

- Removable NEMA 1 outlet boxes provide free access to line terminals.
- Element spacers prevent hot spots.
- Permanent bus bars prevent loose connections.
- CSA approval available on most items.
- Raised face flanges insure leak-tight union with mating flange.
- Lifting rings afford ease of handling.
- Large diameter elements provide extra electrical insulation for better dielectric strength.

Field Wire and Knockout Sizing

Table II

Number of Three Phase Circuits					Field Wire Gauge	Number of Circuits (Three Phase)	Maximum Outlet Box Temperature (°F)

							3	60.9	68.9		
							4-5	43.5	53.7		

Values per NEC 2002 Article 310.

Conduit sizing is based on largest wire insulation thickness for temperature ratings shown.

Consult factory for wire sizes above 1 gauge or if required amps per circuit is above listed values.

*Wire gauges 14, 12 and 10 are sized based on maximum fuse size per NEC Article 240-3.

Flange Heaters

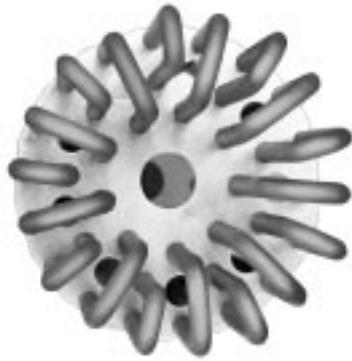

Construction Features (continued)

Outlet Boxes - Removable NEMA 1 outlet boxes are furnished on heaters with 3" through 8" flanges, drawing up to 150 amps. A permanently mounted plate contains electrical knockouts.

On heaters with 10" and 12" flanges, or heaters drawing more than 150 amps, permanently attached NEMA 1 outlet boxes with threaded hubs are provided.

Element Spacers - Element spacers are fabricated from material similar to the element sheath and are normally perforated to allow for maximum fluid flow parallel to the elements. They prevent hot spots caused by elements touching while maintaining the size and rigidity of the heater bundle.

Spacers are provided on 24" maximum centers and are secured in such a manner as to allow elements to expand and contract freely.

Flanges - Raised face flanges carry a nominal 150 lb. rating and are made from forged steel or mill certified steel plate to ANSI standards. Raised face insures a leak-tight gasketed union with mating flange.

Electrical Connections - Pipe flange heaters are furnished with properly sized terminals and conduit openings to match the heater load, number of circuits and operating temperature. Table II shows the maximum amperage per circuit for various gauges of field wiring brought to heaters having one through five circuits. Note: The maximum conduit size is 3".

Unless otherwise specified, heaters are furnished with conduit openings and terminals suitable for a maximum outlet box temperature of 250° F and the number of circuits shown in the table. Heaters ordered with additional circuits, or for higher fluid temperatures, will be furnished with conduit openings and terminals to accommodate the wire gauges shown in Table II.

For three-phase conduits, amperage per circuit is calculated as follows:

$$\text{Total Heater KW} \times 1000$$

$$\text{Line Voltage} \times \text{No. of Circuits} \times 1.73$$

Occasionally low KW heaters operate from single-phase power. In this case, omit the 1.73 factor in the above formula.

When a heater has more than five circuits, or requires field wiring that will not fit into a single 3" conduit, multiple conduit openings will be furnished. For example, a heater with outlet box temperatures of 350° F with six circuits drawing 70 amps each would be furnished with two openings, each sized for 3" conduit. At 70 amps, 250° C insulated 1 gauge field wiring is required for three circuits per conduit.

Gasketing - A 1/16" thick gasket is furnished as standard with each heater. The gasket is sized to match the seating surface on the flange. Spirotallic gaskets are also available.

Flange Temperature/Pressure Ratings - Although pipe flanges have nominal ratings, the actual pressure that they will safely withstand is a function of temperature. Table III below shows pressure ratings per ANSI Standard B16.5.

Flange Pressure Ratings (PSI)

Table III

Maximum Fluid Temperature °F	150 Lb. Steel Flange (Standard)	300 Lb. Steel Flange	150 Lb. Type 304 SS Flange
-20 to 100	285	740	275
200	260	675	235
300	260	655	205
400	200	635	180
500	170	600	170
600	140	550	140
650	125	535	125
700	110	535	110
750	95	505	95
800	80	410	80
850	65*	270*	65
900	50*	170*	50
950	35*	105*	35
1000	20*	50*	20

*These ratings are permissible, but not recommended. Type 304 stainless is preferred above 800° F.

Construction Features (continued)

Bus Bars - Stainless steel bus bars are permanently welded in place to eliminate field failures due to loose bus connections. Copper bus bars are used with lower temperature heaters and where amperage is high.

Large Diameter Elements - Elements measure .475" O.D., providing extra electrical insulation for superior dielectric strength. As a result, elements are suitable for line voltages up to 600 volts. At the same time, uniform heat transfer from coil to sheath is assured by compacting the insulation in high pressure rollers, then repressing all bends to insure insulation integrity in this critical area. Copper sheathed elements are silver soldered to the flange; all other materials are welded.

Unheated Lengths - It is imperative that the entire heated length of an element be submerged in liquid to prevent the sheath from overheating. Normally, copper, steel and stainless steel sheathed heaters have a 2" minimum cold end (unheated length). Incoloy sheathed heaters have a 5" minimum cold end.

Vertically mounted heaters require a longer cold end in applications where the liquid may not otherwise cover the elements.

Terminal Seals - Moisture-resistant epoxy seals are furnished as standard on all copper sheathed heaters operating in maximum fluid temperatures of 250° F.

Since steel, stainless steel and Incoloy sheathed heaters may operate at higher temperatures, standard units in these materials are furnished with mica terminal insulators and without epoxy seals.

When specified, and within temperature limits, epoxy seals are available with steel, stainless steel and Incoloy sheaths.

For applications requiring an absolute seal against moisture, ceramic-to-metal hermetic seals are available for temperatures up to 1000° F.

Lifting Rings - Lifting rings are provided on all heaters with flanges 6" and larger to facilitate handling.

Circuiting - All standard heaters are designed with electrical connections for a maximum outlet box temperature of 250° F with one electrical circuit for single stage operation unless two or more circuits are specified in the listing tables.

Additional circuits are available upon request.

Three phase circuits are always balanced using a multiple of three elements per circuit.

Dimensions - Dimensions shown in Table IV apply to standard heaters.

(1) Add 3" for hubs above 2 1/2" NPT or heaters above 150 amp draw.

(2) Thermostat enclosure can be separate from outlet box.

(3) Riser may be required for 2" and 3" flange heaters with DA thermostat.

Please specify volts, phase, circuits, terminal box rating and, if needed, thermostat range from options listed on page 26.

Flange Heaters

Heater Options

Built-In Thermostat - For fluid temperature control or high limit control. Available in NEMA 1 or liquidproof boxes. See Table IV for outlet box dimensions. Thermostat suitable for pilot duty operation only.

Specify temperature range:

0°–100° F, 60°–250° F or 150°–550° F

Pilot duty rating:

125 VA up to 240 Volts

Integral Thermostat Well - To protect and locate the bulb of a remotely mounted thermostat. Specify well length below flange and inside diameter if the thermostat is supplied by others.

Thermocouple Attached to Sheath - To monitor or limit the sheath temperature. Thermocouple is field-connected to control or to indicating device through jacks furnished in the outlet box. Type K Chromel-Alumel thermocouples with 304 stainless steel sheath, suitable for 1500° F maximum, are standard. Thermocouple is attached to an element in the first circuit near the U-bend unless an alternate location is specified.

Liquidproof/Explosion-Resistant Outlet Boxes - Steel boxes with threaded or bolted cover and female threaded hubs for electrical connections. For applications where there is danger of moisture entering the outlet box or for hazardous locations classified by the National Electrical Code. Consult factory for other types of hazard.

Hermetic Seals - For applications where an absolute moisture seal is required. Each element is fitted with ceramic-to-metal hermetic seals, which are airtight and impervious to outside influences. Seals are designed for terminal temperatures up to 1000° F.

Epoxy Seals - For moisture resistance where the fluid temperature does not exceed 250° F. Each element is sealed with epoxy as a barrier against moisture entering the element. Furnished as standard on copper-sheathed heaters.

150 Lb. Stainless Steel Flanges - Type 304 stainless steel flanges are available where steel flanges may corrode and for fluid temperatures above 800° F. Stainless steel, Incoloy or Inconel elements are welded to the flange; copper elements are silver soldered. See Table III for pressure/temperature ratings. Consult factory for higher pressure ratings.

300 Lb. Steel Flanges - For use where pressure and/or temperature exceed the ratings of standard 150 lb. flanges. See Table III for pressure/temperature ratings. Consult factory for steel flanges rated over 300 lbs.

Larger Flanges - For added KW capacity, or to reduce pressure drop through the heater, larger flanges are available. Standard ANSI flanges available up through 24". Copper sheath available through 18" size only.

Special Flange Materials - Type 316 stainless steel, Incoloy 800, Inconel 600 and Monel 400 flanges are available with elements of matching sheath material for applications where all wetted surfaces are subject to the same corrosion requirements.

Spirotallic Gaskets - Spiral wound Type 304 stainless steel gaskets recommended for extremes in joint relaxation, temperature or pressure cycling, shock or vibration.

Heater Options (continued)

Insulated Flange - Ceramic wool insulation 3" thick is used to reduce heat transfer from the fluid into the terminal box. Recommended for fluid temperatures over 500° F where the fluid temperature exceeds the field wiring insulation rating by more than 50° F, and for dual-purpose heating/cooling applications to prevent condensation in the terminal box during the cooling cycle.

Longer Element Cold Ends - Standard cold ends, 2" for copper, stainless and steel; 5" for Incoloy. In vertically mounted heaters and other applications where the liquid will not completely cover the elements, immersion length should be increased by the length of additional cold end.

Longer Elements - Immersion lengths up to 130" available for applications requiring lower watt densities or heat distribution throughout a long vessel.

Special Bending Configurations - For unusual tank designs or to keep elements covered at all times. For example, elements are normally curved or bent for lube oil reservoirs on shipboard to assure coverage as the ship rolls.

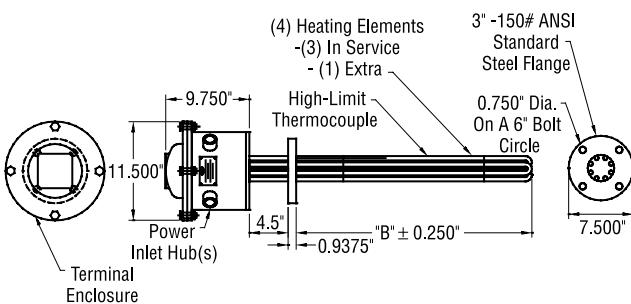

Special Sheath Material - For compatibility with fluid composition and fluid temperature. See Table I for material recommendations. Monel 400, Inconel 600 and Type 316 stainless steel are available.

Passivated Sheath - For corrosion protection. Stainless steel elements are passivated with nitric acid to remove microscopic particles of iron that may be embedded during manufacture.

Additional Circuits - For staged control of heater load. Standard number of heater stages shown in listing tables. Additional stages available consistent with number of elements. (Multiple of three elements required for three-phase circuits.)

Special Ratings - Non-standard KW ratings and special watt densities, required for certain fluids, are available. However, units manufactured with stock elements and standard voltage and wattage ratings provide the advantage of quicker delivery.

Agency Approval - Most pipe flange heaters listed have been approved by CSA (Canadian Standards Association) under File No. LR11895-35. Ratings available up to 600 volts.

Explosion-proof pipe flange heaters have been approved by FM (Factory Mutual), CSA and L.C.I.E. (French Approval Agency) for use in Class I; Divisions 1, 2; Groups B, C, D hazardous locations. These explosion-proof immersion heater approvals include testing to the requirements of European CENELEC Standards EN50014 and EN50018. Consult factory for more information.

Compliance with Military Specifications - Heaters are available to meet a variety of military specifications. For example, for heating lubricating oil on shipboard, we furnish heaters per MIL-H-24299 with hermetic seals and liquidproof outlet boxes, tested per the specification. For water purification, we have furnished heaters per MIL-H-22577C. For heating hydraulic fluid, we have furnished heaters per MIL-S-901 and MIL-STD-167 covering special shock and vibration requirements.

High Temperature Construction - When the outlet box temperature exceeds 250° F, mica terminal insulators are furnished, and properly sized lugs and conduit openings for incoming wiring are provided.

Over-the-Side Heaters

Construction Features

INDEECO Over-the-Side heaters are designed to provide the maximum in application flexibility and to minimize installation cost. They are ideal for jobs where easy installation and quick replacement or cleaning must be accomplished without emptying the tank.

Sludge Leg Spacers - To prevent burnouts from spot overheating and to keep elements out of sludge that normally collects in the bottom of the tank. Standard legs are 1-1/2" high; lengths up to 4" are available at no extra charge.

Reinforced Risers - To strengthen the joint between the riser and element junction box. Gussets are welded or silver soldered to the box and riser to provide this reinforcement.

Extension Arm - To place outlet box 6" away from riser and process tank, preventing damage to electrical connections due to evaporation. Longer arms are available at a nominal additional charge.

High Temperature Lead Wire - Virtually eliminates failure due to overheating in the critical zone between the element junction box and the outlet box. Nickel-clad copper conductors are insulated with Teflon-glass braid to give the wire a 250° C rating.

Liquidproof Outlet Box - Protects electrical connections from wash downs, splashing and dripping. Standard on all heaters.

Large Diameter Elements - Provide extra electrical insulation for superior dielectric strength. Because elements are .475" O.D., they are suitable for line voltages up to 600 volts. In addition, element insulation is compacted by means of high pressure rollers to insure uniform heat transfer from coil to sheath and all bends are repressed to insure insulation integrity in this critical area.

Joints - Heaters have welded joints, pressure tested before assembly.

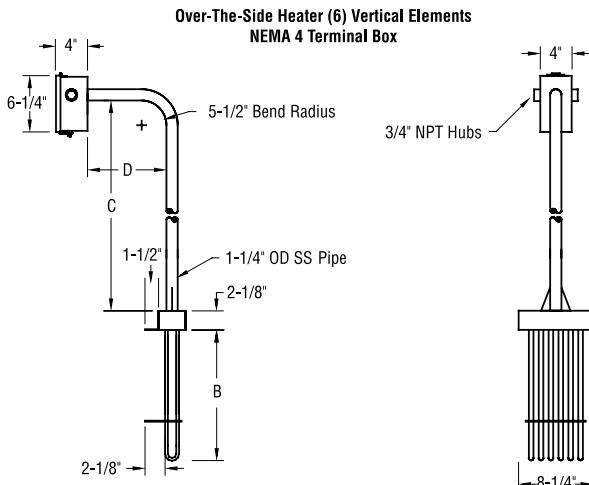

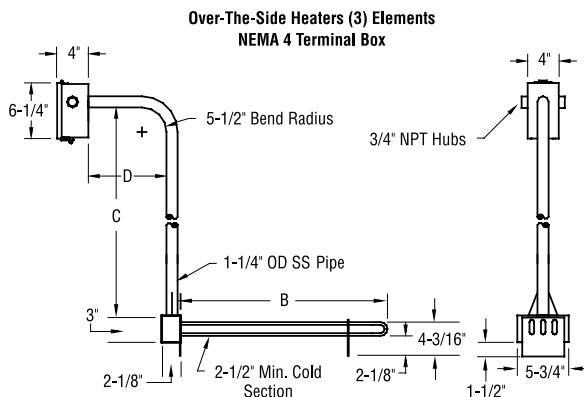

Circuiting - One electrical circuit for single-stage operation is furnished as standard unless two or three are specified in the listing tables. If staged control of the heating process is required, multiple heaters are normally used. However, additional circuits are available if required.

Operating Temperatures - Standard heaters are designed for a maximum operating temperature of 250° F. Contact factory for higher temperature applications.

CSA approvals are available on most Over-the-Side heaters.

Heater Options

A wide range of custom units have been designed. Please contact the factory for more information on any of the following options.

Special Sheath Materials - 316 stainless steel, Incoloy 800, Monel 400 and Inconel 600 are available.

Built-In Thermostat - Built-in automatic temperature control over ranges of either 0°-100° F or 60°-250° F (please specify range on order). The thermostat comes complete with integral ON/OFF switch, pilot light and internal adjusting knob. It is a two-pole device capable of carrying the following KW loads:

Voltage	Capacity in KW	
	Single Phase	Three Phase
120	3.6	—
208	6.2	10.8
240	7.2	12.4
277	8.3	—
480	9.6	—

Above these ratings, a single-pole, pilot duty thermostat is furnished for use with a magnetic contractor.

CSA Approval - Most Over-the-Side heaters have been approved by the Canadian Standards Association (CSA) under File No. LR11895-64. Ratings available up to 600 volts.

Special Sludge Legs - For applications where sludge or sediment at the bottom of the tank may be more than 1-1/2" deep.

Special Riser Height - For heaters installed in tanks that are more than 30" deep. Risers above 96" should use a split coupling to facilitate installation and shipping.

Vertical Mounting - For installations where a horizontal configuration would interfere with workflow through the tank or where servicing a horizontal heater is impractical.

To maintain proper watt density, the heated length should match element lengths and KW ratings shown in the listing tables for standard horizontal Over-the-Side heaters. Fluid level must be maintained above the junction box.

Additional Circuits - For multi-stage control of the heater, additional circuits beyond those shown in the listing tables can be furnished, consistent with the number of elements. Multiple heaters are frequently used for multi-stage control.

Passivated Sheath - For corrosion protection, stainless steel can be passivated with nitric acid to remove microscopic particles of iron that may be embedded during manufacture.

Special Ratings - Higher KW ratings, utilizing longer lengths or additional elements, are available, as are non-standard KW ratings and special watt densities required for certain fluids. 380, 400, 416 and 600 volt ratings are available for foreign installations. Standard voltages are recommended for U.S. installations as these voltages meet most actual job conditions.

Special Arm Length - To bring the outlet box more than 6" away from the side of the tank.

Special Materials - Type 316 stainless steel, Monel 400 and Inconel 600 are available for heating fluids corrosive to standard sheaths. Nickel plating is also available. Terminal box can be 304 stainless steel.

High Temperature Construction - Standard heaters are designed for 250° F operating maximum.

Curved Elements - To fit into a round tank. Elements can be curved to diameters of 10" and greater.

Longer Element Cold Ends - Standard cold ends are 2-1/2" for copper, stainless and steel; 5-1/2" for Incoloy.

Low Water Cut-off Mounting Brackets - Can be added for use with the INDEECO panel for cooling tower freeze protection.

Removable Terminal Box - INDEECO externally threads a one-inch schedule 40 pipe and mounts a cast NEMA 4 terminal box to the riser.

CSA Listed Explosion-proof Heaters

Construction Features

INDEECO explosion-proof pipe thread mounted immersion heaters are CSA approved, File LR11895-74, for use in hazardous areas classified as Class I, Division 1, Groups B, C and D; and Class II, Division 1, Groups E, F and G.

These heaters are available in 2" NPT and 2-1/2" NPT construction. The fittings and element sheath(s) are 304 stainless steel and suitable for NEMA 3 and corrosive environments. A limited offering of 1-1/4" NPT heaters are available subject to restrictions on element count, well size and thermostat range. Consult the factory for additional information.

The end user is responsible for installation. The installation must include a high temperature limit and, if a tank application, a low liquid level control. The INDEECO thermostat, if specified, is for process control of the application.

For details on particular hazardous environments having potential for explosion, refer to Articles 500–516 of the National Electrical Code and/or Section 18 of the Canadian Electrical Code, Part 1.

These heaters are designed to be permanently mounted in a horizontal position above the anticipated sludge level. These heaters are approved for operation in a maximum ambient temperature of 40° C, 104° F.

Selection criteria include determining KW requirements and sheath watt density with an additional calculation of the temperature rating (T rating) **as shown on the facing page.** INDEECO must know the fluid heated, which will appear on the nameplate, illustrated below.

Construction features include .475" diameter compacted tubular element(s), repressed U-bends, nested third element with spacer for structural strength and either 0°–100° F or 60°–250° F process thermostat.

CSA Listed Explosion-proof Heaters

Temperature Code Calculations

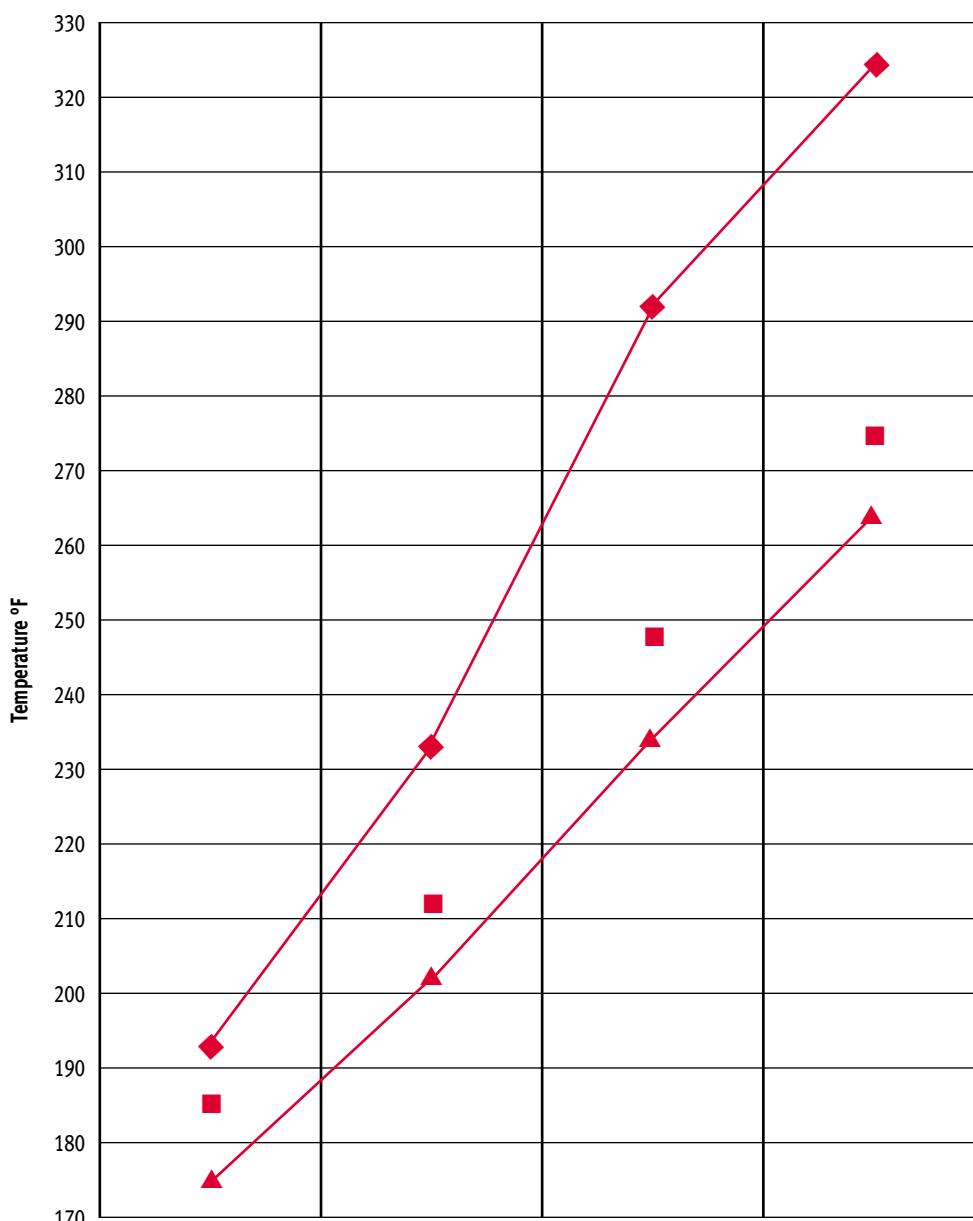

This figure shows the relationship of the process temperature to the temperature identification code number temperature and the heater hot spot temperature for typical installations. Each installation should be checked and tested to determine actual hot spot temperatures.

1. Find the maximum process temperature on the "Y" axis, such as 250° F.

2. Make a line straight across until it crosses the maximum process temperature line (the top line), then make a line straight down from this point to the table below the graph.

3. For a 250° F process temperature, this line falls between Temperature Identification Numbers T5 and T4A. Since it is above T5, T4A is the lowest identification number you could use for this process.

4. Where this line crosses the heater hot spot temperature line (the bottom line), draw a straight line back to the "Y" axis to estimate the heater hot spot temperature. For this 250° F process example, it would be about 210° F.

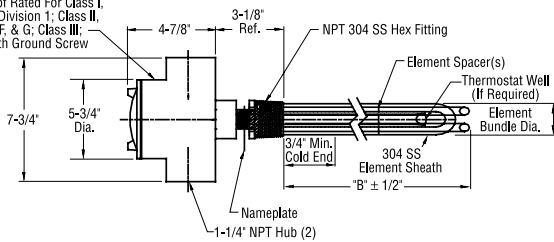

Temperature Identification Number	T6	T5	T4A	T4
◆ Maximum Process Temp., °F	193	233	292	324
■ Maximum Code Temp., °F	185	212	248	275
▲ Heater Hot Spot Temp., °F	175	202	234	264

Tank and Basin Heaters

Pipe Insert Heaters

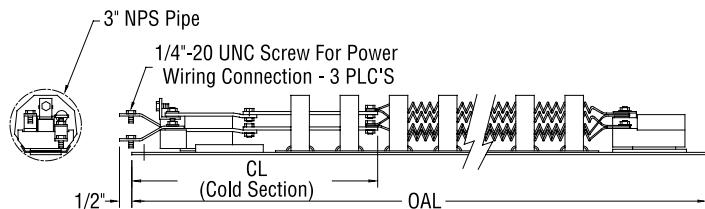

Open Coil Pipe Insert Heaters are designed to insert into a horizontal 3" pipe mounted just above the anticipated sludge level in the tank and below the expected minimum operational fluid level. These units provide a low watt density over a large surface area and are used to heat sensitive fluids. Advantages include the ability to change the heater without draining the tank and to provide up to a Schedule 80 pipe wall in mildly corrosive fluids.

Heater pipes can be customer supplied or provided by INDEECO. Pipes can be welded into the tank wall or can be attached with an ANSI flange. INDEECO can also provide a weather-resistant terminal box with NPT threads attached to the end of the heater pipe.

Consult the factory for custom heaters not represented in the following chart.

Catalog Number	Pipe Length (Inches)	KW at 480V 15 W/Sq. In.
797-129915	48	3.95
797-129916	60	5.5
797-129917	72	7.25
797-129918	84	9
797-129919	96	10.5

797-129923	144	17.5
797-129924	156	19
797-129925	168	20

Based on a 12" cold length.

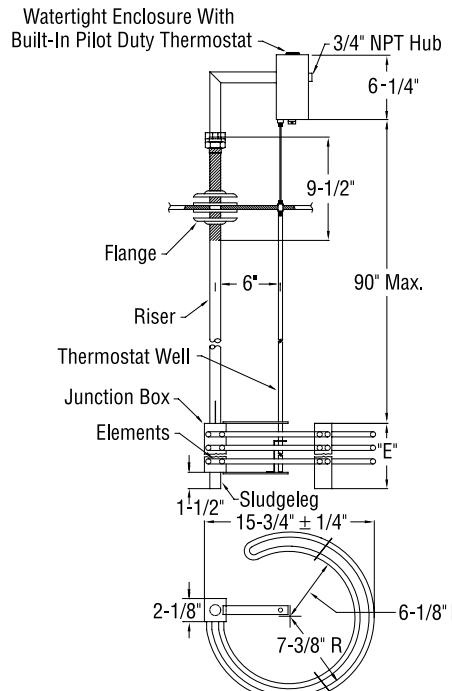

Deep Tank Heaters

Deep Tank Heaters are designed to fit into a manhole of an enclosed tank or double wall tank installed either above or below grade. Often the riser is "split" to facilitate installation. Watt densities can vary from 50 W/Sq. In. for water applications to 5 W/Sq. In. for heavy fuel oils. Controls are often provided to avoid penetrating the tank elsewhere. The element bundle diameter can range from a 12" O.D. to a maximum of 22" O.D.

Cooling Tower Heaters

Cooling Tower Heaters are long cartridge heaters designed with a conservative 25 W/Sq. In. maximum watt density. These units provide a long "gentle" heat covering a majority of the tank or vessel. They are used primarily in below grade concrete sumps, for cooling towers or to heat viscous fluids. The heaters can be specified with through-the-wall or over-the-side construction in 3/4" NPT (Series 761) or 1-1/4" NPT (Series 762).

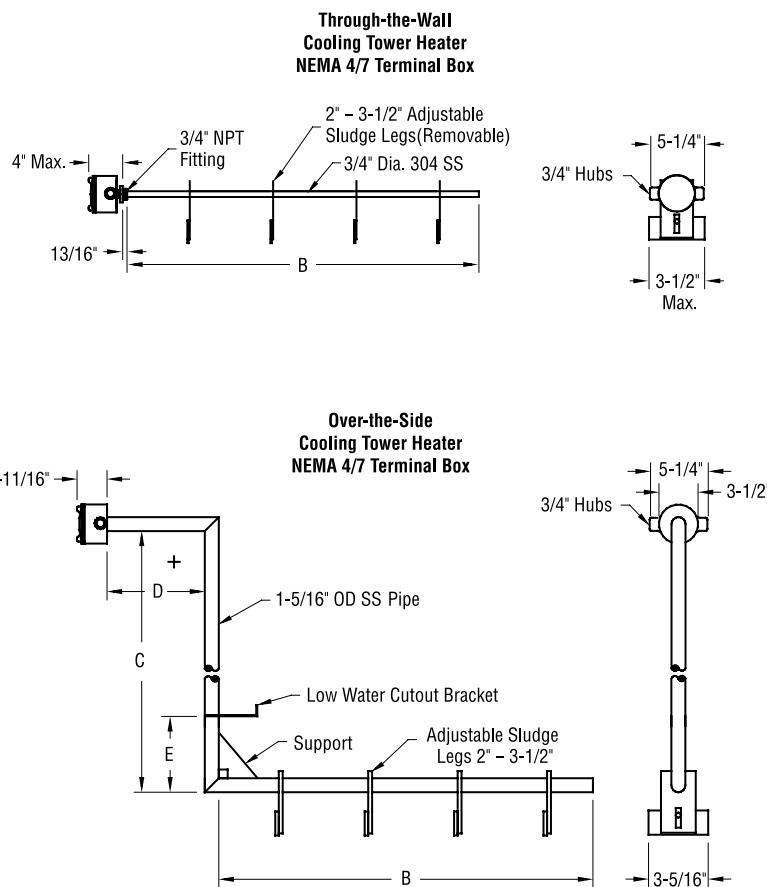

Through-the-Wall Heaters

Series	NPT (Inches)	DIA (Inches)
761	3/4	3/4
762	1-1/4	1-5/16

Over-the-Side Heaters eliminate the need for cutting a hole in the basin. Internal wiring runs from the horizontal heater elements through a vertical riser and extension arm with an outlet box located over the side of the basin.

Adjustable Sludge Legs are furnished on all heaters. Located on five foot centers to keep the element in place even in high water velocities, these legs are adjustable for heights between 2" and 3-1/2".

Liquidproof/Explosion-Resistant Outlet Boxes are furnished on all heaters.

Note: Dimensions B, C, D and E (if required) must be specified when ordering.

INDEECO can provide a control system for any electric heating application. We have built thousands of heater control panels. In-house manufacture of control enclosures in our sheet metal department, and in-house manufacture of electronic controls by our Controls Division, gives INDEECO the flexibility to supply a wide range of remote or built-on control panels to complete the heater control system. Our experienced engineering staff can design control systems ranging from ON/OFF logic to fully proportional SCR, multiple channel and ramp/soak control with computer interface capability.

INDEECO offers two standard control panel designs: Fully proportional SCR control and ON/OFF contactor control. All components are factory mounted and wired in compliance with the National Electrical Code.

Contactor Control Panels

This contactor-based system with ON/OFF process temperature control is recommended for less demanding applications. Systems with two or more heating stages utilize an INDEECO Controls electronic sequencer (step controller), driven by a proportional output temperature controller to minimize the amount of load cycling while providing good outlet temperature control.

Standard Features:

- INDEECO microprocessor-based sequencer (for panels with two or more heating stages)
- Proportional indicating temperature controller (adjustable process temperature with thermocouple input)
- NEMA 12 painted steel enclosure, wall mount unless otherwise noted
- Overtemperature controller (adjustable temperature limit with thermocouple input)
- Manual reset pushbutton with built-in pilot light (red) for visual "OVERTEMPERATURE" alarm
- Door interlock disconnect switch
- Selector switch – ON/OFF with built-in pilot light (green) for "POWER ON" indication
- Control power transformer
- Disconnecting magnetic contactors
- Circuit fusing
- Installation and operation manual

*These panels have double doors and 12" high floor stands.

Control Panels

SCR Control Panels

This fully proportional SCR system with PID temperature control is recommended for industrial heating applications which must accommodate material flow changes and provide the highest degree of accuracy for outlet temperature control.

Standard Features:

- PID self-tuning temperature controller (adjustable process temperature, with thermocouple input)
- INDEECO three-phase, zero cross-fired, SCR power controllers
- NEMA 12 painted steel enclosure, wall mount unless otherwise noted

- Overtemperature controller (adjustable temperature limit with thermocouple input)
- Manual reset pushbutton with built-in pilot light (red) for visual "OVERTEMPERATURE" alarm
- Door interlock disconnect switch
- Selector switch – ON/OFF with built-in pilot light (green) for "POWER ON" indication
- Control power transformer
- Safety contactors
- Circuit fusing

Cooling Tower Control Panels

INDEECO offers a pre-engineered, UL Listed/CSA Approved package for freeze protecting cooling tower basins.

The complete package includes:

- Electric Immersion Heater(s)
- Control Panel with Solid-State Printed Circuit Board
- Sensor Probe with Cord
- Wiring Diagram
- Installation and Operating Instructions

INDEECO offers the following options:

- Disconnect Switch
- Fuses
- Circuit Breaker

INDEECO Heater Control Panels offer these advantages:

Solid-State Control

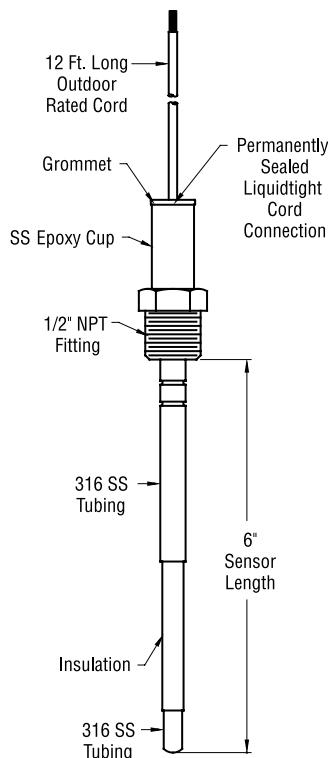

Outmoded bulb and capillary control has been replaced with new patented solid-state technology which combines temperature control with low water level protection in a single solid-state device.

NEMA 4X Enclosure

All controls are factory wired inside a rugged NEMA 4X enclosure designed for wet, outdoor use. Pre-engineered designs up to 96 amps are available with stock and built-to-order listings.

Lower Cost

Installation time and cost are reduced by replacing individually mounted temperature and liquid level control devices with one pre-engineered and assembled control package that requires only one probe to sense both water temperature and level.

Sensor Probe Specifications:

- Sensor Probe: INDEECO probe assembly incorporating both temperature and liquid level sensors. Probe is made out of 316 stainless steel to minimize corrosion. Probe can be installed vertically or horizontally.
- Maximum Pressure Rating for Sensor Probe: 15 psi
- Cord: 12-foot outdoor rated cord with PVC hub connector for installation through tower basin wall. Options include different cord lengths or cord suitable for total immersion.

Cooling Tower Control Panel Specifications:

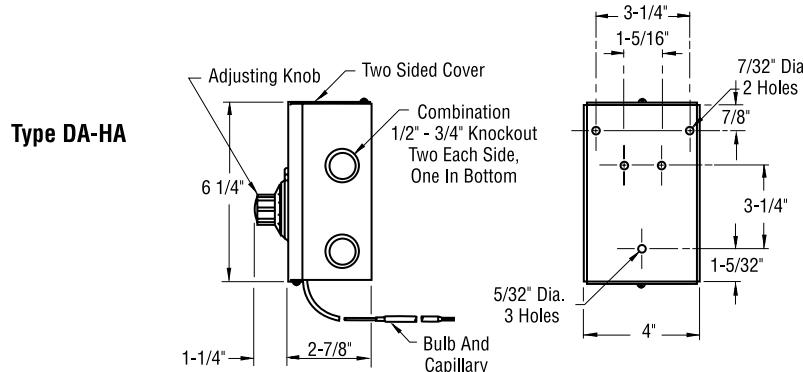

- Solid-State Control: Pre-set 45° F ON/OFF temperature control with 5° F switching differential and built-in low water cutoff. Circuit board LED's provide visual indication of heater-on and liquid level status.
- Ambient Temperature Range: -40° F to 150° F
- Fail Safe: Output relay is de-energized if the input sensor is either open or short-circuited. This prevents heater burn-out problems.
- NEMA 4X enclosure with pre-mounted electrical hubs for conduit connections.
- Single probe to sense both water temperature and water level. Sensor probe supplied with 12-foot outdoor rated cord pre-connected to control panel. Probe also supplied with PVC hub connector for attachments through cooling tower basin wall.
- Nameplate showing maximum KW and amp ratings at system volts/phase.
- System Wiring Diagram.
- Installation and Operating Instructions.
- Rated for maximum of 40 amps or 50 amps with disconnect switch when specified.
- Suitable for multiple heaters per basin (maximum of 2 on 40 amp panel).
- Disconnect switch with door interlock and operator handle, which can be padlocked in the "OFF" position.
- Dimensions: 8" x 10" x 6" for 40 amp size
10" x 12" x 7" for 50 amp size
14" x 16" x 8" for two circuits
- Control panels rated greater than 50 amps are supplied with two circuits and offered either with built-in fusing or a circuit breaker for each circuit.

Thermostats and Accessories

Thermostats

Thermostats may be mounted inside a terminal enclosure or remote mounted (separate from the heater assembly). If using a remote mounted thermostat, be sure to order sufficient capillary tube length to permit installation.

Thermostats regulate temperature in non-critical applications. They sense temperature, within a preset range and cycle heaters on and off to maintain the set point.

Type DA Thermostats

Range °F	Capillary Length (Inches)	Bulb & Capillary Material	Single Phase Thermostats		Three Phase Thermostats	
			Bulb Size (Dia. x Length) (Inches)	Catalog Number	Bulb Size (Dia. x Length) (Inches)	Catalog Number
0-100	48	Copper	3/16 x 14-1/8	DA1-3A48	3/8 x 4-1/8	DA3-6A48
60-250		Copper	—	—	3/16 x 15-3/8	DA3-3C48
200-550		Steel	3/16 x 12-1/2	DA1-3E48	—	—
60-250	96	Copper	3/8 x 4-1/2	DA1-6C96	3/8 x 4-1/2	DA3-6C96
200-550		Steel	3/8 x 3-3/4	DA1-6E96	3/8 x 3-3/4	DA3-6E96
300-700		Steel	3/8 x 3-5/8	DA1-6F96	—	—

Type DA Thermostats (continued)

Voltage	Capacity In KW		
	Single Phase Breaking 2 Lines	Single Phase Breaking 1 Line	Three Phase
120	3.6	7.2	—
208	6.2	12.4	10.8
240	7.2	14.4	12.4
277	8.3	—	—
480	10.0	—	—

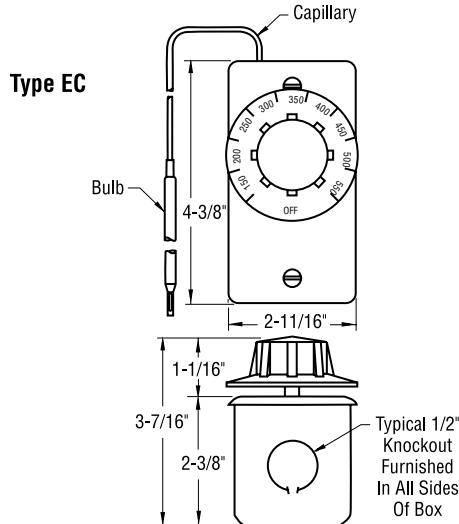

Pilot duty rating is 250VA at 277 volts.

For 480 volt applications, a 480 volt pilot light is normally required.

Type HA Thermostat

Catalog Number	Range °F	Bulb Size (Dia. x Length) (Inches)	Capillary Length (Inches)	Bulb & Capillary Material	Single Phase Capacity in KW				Pilot Duty Rating
					120V	208V	240V	277V	
HA1-3C96	60-250	3/16 x 16-1/4	96	Copper	3.6	6.2	7.2	8.3	250VA
HA1-3E96	200-550	3/16 x 11-1/4	96	Steel	—	—	—	—	120 to 277 V

Thermostats and Accessories

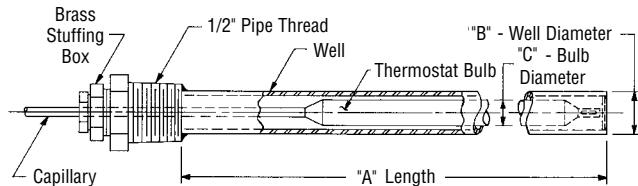

Type EC Thermostats

Catalog Number	Range °F	Bulb Size (Dia. x Length) (Inches)	Capillary Length (Inches)	Bulb & Capillary Material	Single Phase Capacity in KW		
					120V	208V	240V
EC1-6A120	0-100	3/8 x 6	120	Copper			
EC1-6C36	60-250	3/8 x 4-1/2	36	Copper	3	5.2	6
EC1-3D36	150-550	3/16 x 11-3/4	36	Steel			

Pilot duty rating is 125VA at 240 volts maximum, resistive rating of 25 amp up to 250 volts.

All thermostats are available in a painted steel NEMA 4 enclosure.

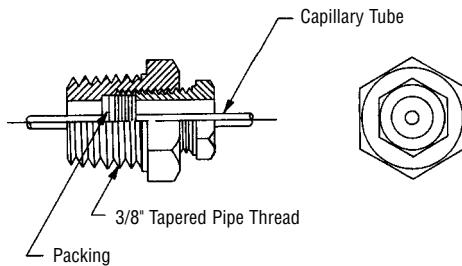

Wells

Wells are used to protect the bulb from corrosion or for mechanical support. Each well is furnished with a brass stuffing box to hold the capillary in place after installation. To order, specify catalog number and thermostat type.

Catalog Number (Stainless)	Dimensions (Inches)		
	A	B	C
WSS12A	12		
WSS18A	18		
WSS24A	24		
WSS36A	36		
WSS06B	6		
WSS12B	12	5/16	3/16
WSS18B	18		
WSS24B	24	9/16	3/8

Pipe Thread Connectors

Pipe thread connectors (stuffing boxes) are used to make a liquid-tight connection where the bulb goes through a tank wall. If the wall is thick enough, it may be drilled and tapped to receive the stuffing box thread. Otherwise, a coupling must be provided.

Part Number	Application		
	Bulb Dia. (Inches)	Thermostat Type	Material

Special Purpose Heaters

Bottom-Mounted Heaters

Bottom-Mounted immersion heaters were originally designed for use in coffee urns. However, their compact construction makes them ideal for use in steam tables, humidifiers, sterilizers and other applications requiring a very low heater profile and a short element length.

Standard Construction

Bottom-Mounted immersion heaters are made with either two or three copper-sheathed tubular elements that are silver soldered to a threaded brass fitting. The fitting is installed through a 2-7/16" diameter hole in the bottom of the vessel, and secured to the vessel by a brass hex nut. The hex nut is an integral part of the NEMA 1 terminal box, which is standard on all units.

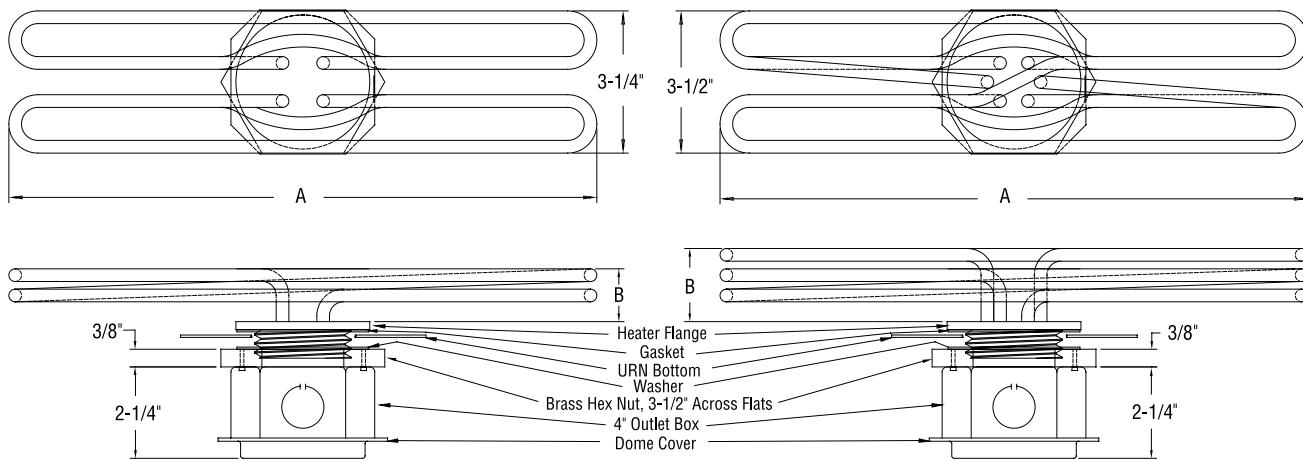

Since standard heaters are made only with copper elements, their use is confined to water or solutions not corrosive to copper or brass. All heaters are designed at a watt density of 50 watts per square inch or less.

Standard heaters are available in 120, 208 and 240 volts. Heaters with two elements are designed for single-phase operation, while three element heaters can also be used for single-phase applications where space limitations preclude the use of a two-element heater.

Special Features

Allen Head Fitting - For convenience of installation, an Allen head fitting can be furnished on a NEMA 1 outlet box. This allows installation with a 3/8" Allen wrench rather than the wide jaw wrench required to fit the large hex nut on the NEMA 1 box.

UL Listing - All standard Bottom-Mounted immersion heaters, with or without a low water cutout, are Listed by the Underwriters Laboratories under Reference E23541.

Special Purpose Heaters

Rectangular Flange Heaters

Large Diameter Elements provide extra electrical insulation for superior dielectric strength. Because elements are .475" diameter, they are suitable for line voltages up to 600 volts. In addition, element insulation is compacted to insure uniform heat transfer from coil to sheath and all bends are repressed to insure insulation integrity in this critical area.

Flanges are fabricated from 3/16" minimum plate. Copper sheathed elements are silver soldered into brass flanges. Steel, Incoloy and stainless steel sheathed elements are welded into flanges of like materials.

Element Spacers, made from 304 stainless steel, maintain a uniform distance between elements, thus preventing hot spots where elements may otherwise touch.

Terminals are 10-32 studs, spot welded to the element cold pin and insulated from the sheath with mica or silicone rubber. Elements are interconnected at the factory with copper or stainless steel bus bars. Cupped washers are furnished for field connections on heaters drawing less than 40 amps. Pressure connectors are furnished for larger heaters.

Moisture-Resistant Epoxy Seals are standard on copper sheathed elements. When the maximum fluid temperature will not exceed 250° F., epoxy seals can be furnished on steel, Incoloy and stainless heaters at no extra charge.

Gaskets are furnished with each heater. A 1/16" pressed fiber gasket is standard.

Special Features

Additional Elements - Up to twelve elements can be furnished in a single flange for applications where concentrated heat is required.

Special Ratings - Non-standard KW ratings and special watt densities, required for certain fluids, are available. Higher KW ratings, using longer elements, are also available.

Special Sheath Materials - Monel, Inconel 600 and Type 316 stainless steel are available for use with fluids that may corrode standard sheath materials. Compatible flange materials can also be furnished.

Alternate Flange Design - Non-standard flange sizes and bolt hole locations are available to match existing installations in the field.

Companion Flanges - A companion flange, made from the same material as the heater flange, is available with drilled and tapped openings matching the heater mounting holes. The companion flange is welded or brazed to the vessel, and the gasket installed between the heater flange and the companion flange.

Longer Element Cold Ends - Standard cold ends are 2-1/2" for copper, stainless and steel; 5-1/2" for Incoloy.

CSA Approval - CSA labeled units are available with construction modifications.

Series 770 Flange Heaters

Series 770 - 4-7/8" flange heaters, are three-element modules specifically designed for large steam or hot water boilers. They offer a simple, practical solution to two problems inherent in all electric boiler designs: element stocking and field replacement.

Series 770 heaters offer an attractive alternative to large pipe flange immersion heaters, which contain a multitude of elements and are therefore more difficult and more expensive to replace in the field. By using Series 770 heaters, element replacement is simplified; should an element burn out, it is only necessary to remove one small flange. The rest of the elements can remain in service. (Even when the elements are mounted into a pipe flange immersion heater with compression fittings, it is usually impractical to replace an element after the heater has been in service for some time, as the entire flange must be removed and elements tend to become encrusted with water deposits.)

Series 770 heaters are installed through a 2-3/8" diameter opening in a blind flange or a flat boiler head having a minimum thickness of 1-1/4". Eight 1/2" bolts hold the flange in place. Horizontally mounted elements must be supported at three-foot intervals.

Limited Warranty

Industrial Engineering and Equipment Company (INDEECO) products are warranted against defects in workmanship, material, design, labeling and packaging. No other warranty, expressed or implied, written or oral, applies. No person other than an officer or the general manager of INDEECO is authorized to give any other warranty or assume any liability.

Warranty Period: This warranty is effective for eighteen months from the date of shipment of the product from INDEECO's factory, or for twelve months from the date the product is first placed in service, whichever period lapses first.

Conditions of Warranty: INDEECO products must be installed, operated and maintained in accordance with INDEECO's instructions. INDEECO is not liable for damage or unsatisfactory performance of the product resulting from accident, negligence, alteration, unauthorized repair, improper application or installation of the product, improper specifications or corrosion. INDEECO IS NOT LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES. Claims against carriers for damage in transit must be filed by the purchaser with the carrier.

Remedy: The part or product in question should be returned, freight prepaid, to:

INDEECO
425 Hanley Industrial Court
St. Louis, Missouri 63144
Attention: Return Goods Manager

If after receipt of the product and the claim, INDEECO finds to its reasonable satisfaction that the product is defective in workmanship, material, design, labeling or packaging, the product will be repaired or replaced or the purchase price refunded at INDEECO's option. There will be no charge to the purchaser for parts or labor. Removal and reinstallation of the product, and shipment of the product to INDEECO for repair or inspection shall be at the purchaser's risk and expense.

THE REPAIR, REPLACEMENT OR REFUND PROVIDED FOR IN THIS LIMITED WARRANTY IS THE EXCLUSIVE REMEDY OF THE PURCHASER. THIS WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. THERE ARE NO WARRANTIES WHICH EXTEND BEYOND THE TERMS OF THIS LIMITED WARRANTY.
